Apache2 Ubuntu Default Page

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   '-- ports.conf
|   '-- mods-enabled
|       '-- *.load
|       '-- *.conf
|-- conf-enabled
|   '-- *.conf
|-- sites-enabled
|   '-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
- Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.

They are activated by symbolic-linking available configuration files from their respective `*.available`

Enabling module headers.
To activate the new configuration, you need to run:
    systemctl restart apache2
vini@vini-VirtualBox:~$ sudo a2enmod env
Module env already enabled
vini@vini-VirtualBox:~$ sudo a2enmod dir
Module dir already enabled
vini@vini-VirtualBox:~$ sudo a2enmod mime
Module mime already enabled
vini@vini-VirtualBox:~$ sudo systemctl restart apache2
vini@vini-VirtualBox:~$
```

The screenshot shows a terminal window titled "Terminal" with the command "GNU nano 2.9.3" running. The file being edited is located at "/etc/apache2/conf-available/owncloud.conf". The configuration includes:

```
Alias /owncloud "/var/www/owncloud/"

<Directory /var/www/owncloud/>
    Options +FollowSymlinks
    AllowOverride All

    <IfModule mod_dav.c>
        Dav off
    </IfModule>

    SetEnv HOME /var/www/owncloud
    SetEnv HTTP_HOME /var/www/owncloud

</Directory>
```

The status bar at the bottom indicates "[Wrote 14 lines]".
